

Feb. 21st - SECOND RECORD OF THINKING

Between the first record of thinking a this, I have made a lot of headway on the main bulk of my project. I learned a lot more about swing and action listener. Action Listener is the part of swing that controls what happens when user input is detected. It is a method within the view class that I have begun to manipulate a lot to interact with the other classes and display the right information. I decided that the info for the survey questions should go into a 2D array. There will be an array with 5 spaces, one for each survey question. Each question is an array and within each question will hold the data for each course. Each question will have about 40 spaces for each of the 40 courses. I spent a great deal of time cleaning up and organizing my code. As we wind down the second week of work, I can see a great deal of progress, but with that progress came a bit of a mess in my code. Making it past the first wall of code wasn't very graceful. I still need to figure out how to match the course string ID with the index in the 2D array. After that, I still need to figure out how to call that specific index and display the correct and averaged information for the user.
